### test.che<u>ck shrink tree</u>

### test check shrink tree

### test check shrink tree

#### The Problem

• the lazy shrink-tree is nondeterministic

#### The Solution

- Use an immutable, splittable RNG.
  - But where do you find such a thing?

э

# Splittability and Composition Summary

- A 🖓

- Linear RNGs hinder composition
  - Programs are either nondeterministic or impossible to write
- Splittable RNGs are less common, but composition-friendly
- test.check impl is fragile because of its linear RNG

#### Splittable Pseudorandom Number Generators using Cryptographic Hashing

Koen Claessen Michał H. Pałka

Chalmers University of Technology koen@chalmers.se michal.palka@chalmers.se

#### Abstract

We propose a new splittable pseudorandom number generator (PRNG) based on a cryptographic hash function. Splittable PRNGs, in contrast to linear PRNGs, allow the creation of two (seemingly) independent generators from a given random number generator. Splittable PRNGs are very useful for structuring purely functional programs, as they avoid the need for threading around state. We show that the currently known and used splittable PRNGs are either not efficient enough, have inherent flaws, or lack formal arguments about their randomness. In contrast, our proposed generator can be implemented efficiently, and comes with a formal statements and proofs that quantify how 'random' the results are that are generated. The provided proofs give strong randomness guarantees under assumptions commonly made in cryptography. The function split creates two new, independent generators from a given generator. The function next can be used to create one random value. A user of this API is not supposed to use both next and split on the same argument; doing so voids all warranties about promised randomness.

The property-based testing framework QUICKCHECK [13] makes heavy use of splitting. Let us see it in action. Consider the following simple (but somewhat contrived) property:

```
newtype Int14 = Int14 Int
deriving Show
```

```
instance Arbitrary Int14 where
arbitrary = Int14 'fmap' choose (0, 13)
```
